Diabetes in South Carolina

S.C. ranks 5th highest in the nation in the percent of population with diabetes

- Approximately 1 in 7 African-Americans in South Carolina has diabetes – the 16th highest rate of diabetes among African-Americans in the nation.
- The prevalence of diabetes increases with age – a dramatic increase can be seen among those 45 years of age and older.
- Diabetes is the seventh leading cause of death in South Carolina after cancer, heart disease, stroke, chronic lower respiratory disease, accidents, and Alzheimer’s.
- In 2009, three people died each day from diabetes – that is one death from diabetes every 8 hours.
- About 70 percent of adults with diabetes have high blood pressure.
- Uncontrolled diabetes can lead to many complications including blindness, kidney failure, heart attacks, strokes and amputations.

Healthcare Costs

- In 2010, the total amount for hospital charges related to diabetes as a primary diagnosis in South Carolina was $254.5 million.
- Medicare and Medicaid paid for almost 60% of this cost.
- Diabetes hospital costs have increased by 50 percent in the past five years in South Carolina.

Who needs to be tested for diabetes?

Everyone needs to be tested for diabetes beginning at age 45. Earlier testing is recommended if you are overweight and have certain risk factors such as:

- Physical inactivity
- First-degree relative with diabetes
- Members of a high-risk ethnic population (African-Americans, Hispanics or Native Americans)
- Hypertension
- Elevated LDL cholesterol or triglyceride level
- Women with polycystic ovarian syndrome, history of cardiovascular disease or gestational Diabetes
Types of Diabetes:

**Type 1 Diabetes** – Usually diagnosed in children and young adults. The body does not produce insulin. People with type 1 diabetes must take insulin injections.

**Type 2 Diabetes** – The body does not produce enough insulin and/or the body cannot properly use insulin. When glucose builds up in the blood instead of going into cells, the complications of diabetes can occur over time. Type 2 diabetes in children is on the rise due to the childhood obesity epidemic, particularly in African-Americans and Hispanics.

**Gestational Diabetes** – Pregnant women who have high blood glucose levels have gestational diabetes. They are more likely to develop type 2 diabetes years later.

**Pre-diabetes** – Before people develop type 2 diabetes, they almost always have “pre-diabetes.” People with pre-diabetes are at higher risk of cardiovascular diseases. However, you can delay or prevent the onset of type 2 diabetes by eating healthily and being physically active.

Your doctor can do a simple blood test to determine if you have diabetes. A fasting blood glucose level between 100 and 125 mg/dl signals pre-diabetes. A fasting blood glucose level of 126 mg/dl or higher diagnoses diabetes.

*The American Diabetes Association recommends that people with diabetes should:*

<table>
<thead>
<tr>
<th>Have an eye exam every year</th>
<th>Have a foot exam every year, examine your feet daily</th>
</tr>
</thead>
<tbody>
<tr>
<td>Have an A1C test at least twice a year</td>
<td>Have your blood pressure checked regularly</td>
</tr>
<tr>
<td>Get regular dental exams</td>
<td>Have your cholesterol checked at least once a year</td>
</tr>
<tr>
<td>Get a flu shot every year</td>
<td>Check your blood sugar regularly</td>
</tr>
<tr>
<td>Get a pneumonia shot at least once in a lifetime</td>
<td>Complete a diabetes self-management education course</td>
</tr>
</tbody>
</table>

**Important points to remember:**

- People with diabetes can live long, healthy lives when their diabetes is properly managed.
- Diabetes can be prevented or delayed by eating healthily, being physically active, not smoking and losing 5 to 10 pounds.
- The complications of diabetes can be prevented when the person with diabetes manages their diabetes. This includes eating healthily, being physically active, not smoking, taking medication as prescribed and managing stress.
